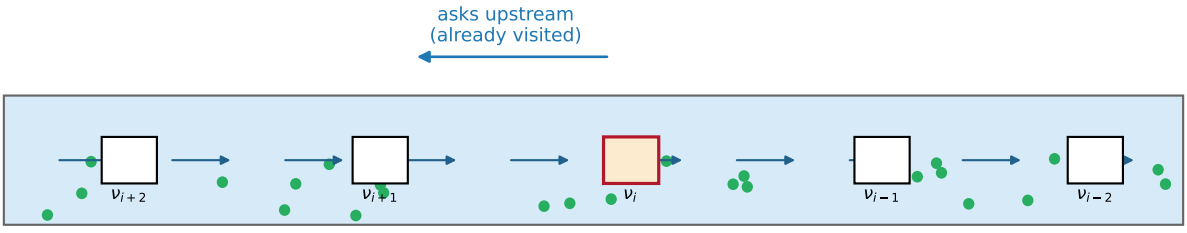
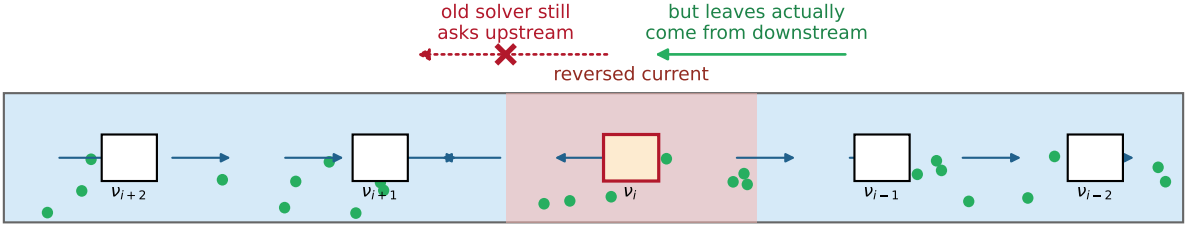
Expanding ($\Gamma > 0$): normal stretch



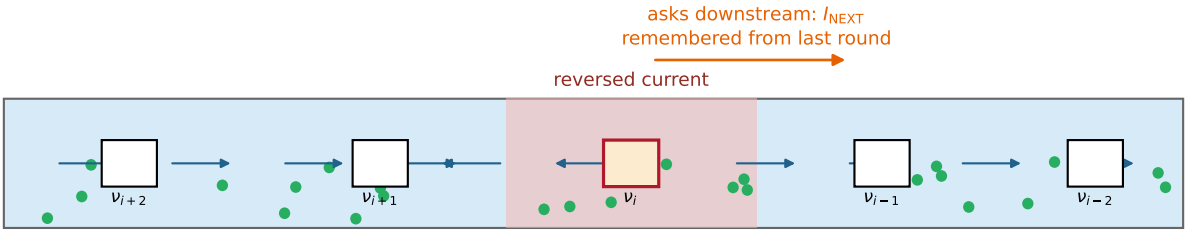
leaves always arrive from upstream (high ν)

Compressing ($\Gamma < 0$): the old solver breaks



signed current also gives negative muddiness: leaves multiply, intensities blow up

Compressing ($\Gamma < 0$): the Knop fix



muddiness uses $|\Gamma|$ only: always positive, always attenuates

towns = frequency-grid points, leaves = photons (I_ν), current = velocity coupling Γ, muddiness = opacity $\hat{\chi}$
